## THE A-SERIES

At the heart of the Membrattech® A series are two specially developed hydrocarbon membranes whose pores are 1 million times finer than a human hair and safely remove even small molecular foreign substances such as viruses, hormones and drug residues from drinking water. A further advantage is their chemical resistance and non-stick surface to prevent deposits on the membranes. A UV-unit additionally avoids re-germination via the water outlet.

- ✓ All models of the Membrattech® A-Series are equipped with a Direct-Flow system as standard. This eliminates the risk of contamination of storage tanks.
- ✓ The intelligent Secure-OPT security system monitors all performance-relevant processes around the clock and even detects changes in raw water.
- ✓ Depending on the model, the Membrattech® A Series generates between 80-300 litres/hour and offers you up to four types of water. Choose between ambient, cold, hot or sparkling water.
- ✓ The integrated "Flush-Out" function sucks off the remaining water in the pipes after successful water withdrawal to prevent water stagnation.
- ✓ The Membrattech® A series is equipped as standard with a patented water-cooled motor. The advantage is, among other things, higher performance at lower electricity costs.
